## THE ALCHEMIST'S FOCAL BANGER CLONE (ALL-GRAIN)

(5 gallons/19 L, all-grain)  
OG = 1.063 FG = 1.012  
IBU = 80 SRM = 5 ABV = 7%

While the recipe for Focal Banger has been known to change over the years, the Citra®/Mosaic® hop combo has been one thing that hasn't changed. Pilsner malt has been known to be part of the grain bill, so feel free to substitute in some for the Pearl malt.

### Ingredients

12 lbs. (4.3 kg) Thomas Fawcett Pearl malt  
1.2 lbs. (0.54 kg) corn sugar (15 min.)  
4 mL HopShot™ (60 min.)  
1.5 oz. (43 g) Citra® hops (0 min.)  
2.5 oz. (71 g) Mosaic® hops (0 min.)  
2.5 oz. (71 g) Citra® hops (dry hop)  
1.5 oz. (43 g) Mosaic® hops (dry hop)  
The Yeast Bay (Vermont Ale) or GigaYeast GY054  
(Vermont IPA) or East Coast Yeast ECY29 (North East Ale)  
or Omega Yeast Labs (DIPA Ale) yeast  
¾ cups corn sugar (if priming)

### Step by Step

This recipe is designed for homebrewers to achieve 5.5 gallons (21 L) wort in their fermenter on brew day. This will help offset the loss of volume to the heavy hopping rate of this beer.

Build your water profile, starting with either very soft water or RO water. Target a water profile of 250:100 PPM sulfate:chloride. Crush the malt and add to 4 gallons (15 L) strike water to achieve a stable mash temperature at 154 °F (68 °C). Raise to mash out and begin to laut. Boil for 60 minutes, adding the HopShot™ addition after the wort comes to a boil and the corn sugar with 15 minutes left in the boil. After you turn off the heat, add the final addition of hops, then stir the wort and let settle for 30 minutes with the lid on before cooling to yeast pitching temperature.

Ferment at 68 °F (20 °C). As fermentation nears completion, transfer the beer to a keg and add the dry hops and attach a spunding valve. Let the beer sit on the hops for 3–4 days, then transfer to a serving keg or bottling bucket. Bottle with priming sugar or force carbonate the serving keg to 2.4 volumes CO<sub>2</sub>.

## THE ALCHEMIST'S FOCAL BANGER CLONE (EXTRACT ONLY)

(5 gallons/19 L, extract only)  
OG = 1.063 FG = 1.012  
IBU = 80 SRM = 5 ABV = 7%

### Ingredients

6.6 lbs. (3 kg) Maris Otter liquid malt extract  
1.2 lbs. (0.54 kg) Pilsen dried malt extract  
1.2 lbs. (0.54 kg) corn sugar (15 min.)  
4 mL HopShot™ (60 min.)  
1.5 oz. (43 g) Citra® hops (0 min.)  
2.5 oz. (71 g) Mosaic® hops (0 min.)  
2.5 oz. (71 g) Citra® hops (dry hop)  
1.5 oz. (43 g) Mosaic® hops (dry hop)  
The Yeast Bay (Vermont Ale) or GigaYeast GY054  
(Vermont IPA) or East Coast Yeast ECY29 (North East Ale)  
or Omega Yeast Labs (DIPA Ale) yeast  
¾ cups corn sugar (if priming)

### Step by Step

Heat 5 gallons (19 L) soft or RO water up to boil. As soon as the water begins to boil, remove from heat and stir in the liquid and dried malt extracts. Stir until all the extract is dissolved then return the wort to a boil. Boil for 60 minutes, adding the HopShot™ addition after the wort comes to a boil and the corn sugar with 15 minutes left in the boil. After you turn off the heat, add the final addition of hops, then stir the wort and let settle for 30 minutes with the lid on before cooling to yeast pitching temperature. Top off your fermenter to 5.5 gallons (21 L).

Ferment at 68 °F (20 °C). As fermentation nears completion, transfer the beer to a keg, add the dry hops, and attach a spunding valve. Let the beer sit on the hops for 3–4 days, then transfer to a serving keg or bottling bucket. Bottle with priming sugar or force carbonate the serving keg to 2.4 volumes CO<sub>2</sub>.

### Tips for Success

One of the secrets to John Kimmich's success at brewing these beers is making sure to minimize the amount of dissolved oxygen (DO) in the beer. To do the same at home, be cautious when racking. You can also purge your receiving vessel with CO<sub>2</sub> before transfer to minimize exposure to oxygen when you're moving the beer from vessel to vessel.

Also, minimize oxygen exposure when you add the dry hops. To do this, try vacuum packing your hops before adding them to your beer, or better yet, vacuum pack them and then gas flush them with CO<sub>2</sub>. (ALL-GRAIN)**

**(5 gallons/19 L, all-grain)**  
**OG = 1.059 FG = 1.011**  
**IBU = 48 SRM = 4 ABV = 5.9%**

**Ingredients**

12.5 lbs. (5.7 kg) 2-row pale malt  
4.1 AAU Cascade pellet hops (60 min.)  
(0.5 oz./14 g at 8.2% alpha acids)  
6.2 AAU Cascade pellet hops (45 min.)  
(0.75 oz./21 g at 8.2% alpha acids)  
0.5 oz. (14 g) Cascade pellet hops (0 min.)  
1 oz. (28 g) Cascade pellet hops (dry hop)  
White Labs WLP051 (California Ale V)  
or Wyeast 1272 (American Ale II) yeast  
0.3 oz. (8 g) gypsum (optional if using very low mineral water)  
2/3 cup corn sugar (if priming)

**Step by Step**

Mill the grains and mix with 4.7 gallons (17.8 L) of 158 °F (70 °C) strike water and optional gypsum (see ingredients list) to reach a mash temperature of 149 °F (65 °C). Hold this temperature for 60 minutes. Vorlauf until your runnings are clear. Sparge the grains with 2.8 gallons (10.6 L) of 168 °F (75 °C) water and top up with water to obtain 6 gallons (23 L) of 1.049 specific gravity wort. Boil for 60 minutes, adding hops according to the ingredients list.

After the boil, turn off the heat and chill the wort to slightly below fermentation temperature, about 65 °F (18 °C). Aerate the wort with pure oxygen or filtered air and pitch yeast. Ferment at 67 °F (19 °C) for four days. Add the dry hops and raise to 72 °F (22 °C) for three days. Once the beer reaches terminal gravity (approximately seven days total) bottle or keg the beer and carbonate.

**Ingredients**

8 lbs. 3 oz. (3.7 kg) golden liquid malt extract  
4.1 AAU Cascade pellet hops (60 min.)  
(0.5 oz./14 g at 8.2% alpha acids)  
6.2 AAU Cascade pellet hops (45 min.)  
(0.75 oz./21 g at 8.2% alpha acids)  
0.5 oz. (14 g) Cascade pellet hops (0 min.)

White Labs WLP051 (California Ale V) or  
Wyeast 1272 (American Ale II) yeast  
0.2 oz. (6 g) gypsum (optional if using very low mineral water)  
2/3 cup corn sugar (if priming)

**Step by Step**

Bring 5.4 gallons (20.4 L) of water and optional gypsum (see ingredients list) to boil, turn off the flame, and stir in the liquid malt extract until completely dissolved. Top up with water if necessary to obtain 6 gallons (23 L) of 1.049 specific gravity wort.

Boil for 60 minutes, adding hops according to the ingredients list. After the boil, turn off the heat and chill the wort to slightly below fermentation temperature, about 65 °F (18 °C). Aerate the wort with pure oxygen or filtered air and pitch the yeast.

Ferment at 67 °F (19 °C) for four days. Add the dry hops and raise to 72 °F (22 °C) for three days. Once the beer reaches terminal gravity (approximately seven days total) bottle or keg the beer and carbonate.

**Tips for Success:**

Anchor's ales spend three days in open fermentation and the temperatures are allowed to ramp over that time. If you want to do an open fermentation at home, focus on producing extremely sanitary wort, cleaning and sanitizing everything the wort comes in contact with, and pitching a known pure and viable yeast strain. A fermentation vessel such as a bucket can be used, and if you're paranoid about contamination from fruit flies you can stretch some cheesecloth over the top. To replicate Anchor's process you would rack to a closed vessel with an airlock such as a carboy after three to four days and do any dry hopping there.

4 lbs. (1.8 kg) Muntons light dried malt extract

(British Ale) yeast (1.5 qt./~1.5 L starter @ SG 1.030)  
7/8 cup corn sugar (if priming)

**Step by Step**

Steep crushed malt at 152 °F (67 °C) in 2.25 qts. (2.1 L) of water. This is a partial mash, so follow temperature and volume guidelines closely. After 45 minutes, rinse grains with 1 qt. (~1 L) of 170 °F (77 °C) water. Add water to “grain tea” to make 4 gallons (15 L). To save time, heat ~3.5 gallons/13 L of water during “steep.” Stir in the dried malt extract and bring to a boil. During the boil, do not let wort volume drop below 3.5 gallons (13 L). Add boiling water if wort volume dips near this mark. Begin hopping wort with a continuous stream of Warrior® hops at a rate of 0.28 oz. (7.9 g) per 10 minutes. Warrior® should run out with 35 minutes left in boil. Refill hopper with Simcoe® and Amarillo® hops and resume hopping until the end of the boil. With 15 minutes left in the boil, turn off the heat and stir in liquid malt extract and Irish moss. Resume heating once extract is dissolved. After the boil is complete, add 0 minute hops and begin cooling. After chilled wort is transferred to fermenter, add water to make 5 gallons (19 L). Ferment initially at 71 °F (22 °C), but let temperature rise to 74 °F (23 °C) towards the end of fermentation. Warm condition for three days (to remove diacetyl), then cool beer and add dry hops, allowing two weeks contact time. Bottle or keg as usual.

(California Ale), Lallemand BRY-97, Mangrove Jack's M44  
(US West Coast), or Safale US-05 yeast  
⅔ cup corn sugar (if priming)

**Step by Step**

This is a single step infusion mash, mashing at 158 °F (70 °C) to create a fuller-bodied beer. Mix all the crushed grains with 3.5 gallons (13 L) of 170 °F (77 °C) water and stabilize the mash at 158 °F (70 °C) for 60 minutes. Raise the mash temperature to 165 °F (74 °C) and sparge with enough 175 °F (79 °C) water to collect approximately 6 gallons (23 L) of wort.

Boil the wort for 60 minutes. Add the first hop addition of Amarillo® at the beginning of the boil primarily as a foam inhibitor. Add the Irish moss for the last 30 minutes. Turn off the burner and remove the pot from the heat source. Now add 5 oz. (142 g) of Amarillo® hops, and stir to mix in. After about three to four minutes, begin using your wort chiller to drop the temperature of the wort to 170 °F (77 °C) and hold for 15 minutes. After that time continue to chill to yeast pitching temperature. This extracts a small amount of hop bitterness, and a large amount of hop flavors.

When you have cooled the wort to about 80 °F (27 °C), you can strain the wort into a fermenter. Aerate the wort and pitch the yeast. Ferment at 68–70 °F (20–21 °C) to help hold the aromatics in the beer. When fermentation is complete, rack the beer off the trub and add the remaining dry hop addition of Amarillo®. Allow the beer to absorb the dry hop flavors for about four days. Bottle or keg as normal.

**Step by Step**

Two or three days before brew day, make the yeast starter, aerating the wort thoroughly (preferably with oxygen) before pitching the yeast.

On brew day, mash in at 157.5 °F (69.7 °C) in 17 qts. (16 L) of water. Hold at this temperature for 60 minutes. Raise mash temperature to 170 °F (77 °C), hold for 5 minutes then recirculate until the wort clears. Run off wort and sparge with water hot enough to keep the grain bed around 170 °F (77 °C). Collect 6.75 gallons (25.5 L) of wort. (Check that final runnings do not drop below a specific gravity of 1.010 or the pH climbs above 5.8.) Boil wort for 100 minutes, adding hops at times indicated in the ingredient list. Ferment at 68 °F (20 °C). Dry hop in secondary for five days.

Keep some boiling water handy and do not let the boil volume dip below 3 gallons (11 L). With 15 minutes remaining in the boil, remove your brew pot from the flame and add the liquid malt extract, stirring thoroughly to avoid scorching. Return to heat and finish boiling. Once complete, chill wort, transfer to fermenter and top up to 5 gallons (19 L). Aerate wort and pitch yeast. Ferment at 68 °F (20 °C). Dry hop in secondary fermenter for five days.

This recipe is designed for homebrewers to achieve 5.5 gallons (21 L) wort in their fermenter on brew day. This will help offset the loss of volume to the heavy hopping rate of this beer.

Build your water profile to achieve a 100:200 PPM sulfate:chloride profile. Crush the malt and add to 4.5 gallons (17 L) strike water to achieve a stable mash temperature at 154 °F (68 °C). After 60 minutes, begin to laut. Collect 7 gallons (26.5 L) of wort in the kettle. Boil for 60 minutes, adding the hop extract after the wort comes to a boil and the turbinado sugar with 15 minutes left in the boil. After the boil, chill the wort down to 180 °F (82 °C) and then add the hop stand addition. Stir the wort, then let settle for 30 minutes before cooling to yeast pitching temperature. Ferment at 68 °F (20 °C). As the kräusen begins to fall, typically day 4 or 5, add the dry hops and spunding valve. Let the beer sit on the hops for 3 days.

### Step by Step

This recipe is designed for homebrewers to achieve 5.5 gallons (21 L) wort in their fermenter on brew day. This will help offset the loss of volume to the heavy hopping rate of this beer.

Build your water profile, starting with either very soft or RO water. Target a water profile of 200:100 PPM sulfate:chloride. Crush the malt and add to 4 gallons (15 L) strike water to achieve a stable mash temperature at 150 °F (65.5 °C). After 60 minutes, begin to laut. Boil for 60 minutes, adding the first hop addition after the wort comes to a boil and a second hop addition with 10 minutes left in the boil. After the boil, chill the wort to 180 °F (82 °C) and then add the hop stand addition. Stir the wort, then let settle for 30 minutes before cooling to yeast pitching temperature. Ferment at 68 °F (20 °C). As the kräusen begins to fall, typically day 4 or 5, transfer to a keg with the dry hops and add a spunding valve. Let the beer sit on the hops for 4-5 days, then transfer to a serving keg or bottling bucket. You may want to cold-crash the beer prior to the transfer by dropping the temperature of the beer to 35 °F (2 °C) for 24 hours.

Bottle with priming sugar or force carbonate the serving keg to 2.4 volumes CO<sub>2</sub>.
